Masters of PMI - Episode 1: What is Positive Material Identification (PMI) Testing? Positive Material Identification Pmi 1

POSITIVE MATERIAL IDENTIFICATION (PMI) 1.0 INTRODUCTION Positive Material Identification (PMI) is one of the more specialised non destructive testing methods. With positive material identification the alloy composition of materials can be determined. If a material certificate is missing or it is not clear what the composition of a material is, then PMI offers the solution.

Positive material identification (PMI) testing is the examination of a material, usually a metallic alloy, to confirm the material is consistent with the user's request. In general, this is done using one or more of three testing methods: Handheld XRF, Handheld LIBS, or Portable OES.

## What is PMI Testing (Positive Material Identification)?

This Practice provides the minimum Positive Material Identification (PMI) requirements to ensure that only the alloy materials specified in the contract documents are provided in equipment, equipment internals, piping and piping components, and weld consumables.

## Positive Material Identification Specification

PMI (Positive Material Identification) testing is the analysis of materials to determine the chemical composition of a metal or alloy at particular (usually multiple) steps of alloy manufacturing or in-process alloy installation. Knowing the exact composition and grade of an alloy enables suppliers, plant workers, and other responsible parties in the chain of custody of components to match alloy specifications that are chosen for their specific properties such as heat resistance, corrosion ...
